

Drishti in three minutes

Read the left column, do the right column. Written to be **spoken, not read aloud**, and each beat's word count is sized to its seconds at a relaxed pace – so you can take your time and still land on three minutes. Numbers are spelled the way you would say them.

BEFORE YOU HIT RECORD

- 1. **Warm the engine.** Open the app two minutes early and wait for the status bar to read **ENGINE LIVE**. A cold start shows zeros and will ruin the take.
- 2. **Open these tabs in order** so you never navigate live: `/app/index.html` · `?group=SER-001` · `?tab=forecast` · `?tab=network` · `?tab=triage` · `?tab=model`
- 3. **1920×1080, full screen, no bookmarks bar.** Hide the cursor when not pointing.
- 4. **Dry-run the clicks once, silently.** The riskiest beats are the triage form and the person click in the network graph.

0:00 The gap

20 sec

SAY

"Across Karnataka thousands of unsolved cases sit in the system, and they stay isolated for one simple reason – the FIR database has **no offender ID**. An accused is only a name typed into a single FIR, so when the same person works across several stations, nobody ever connects them."

50 words

DO

- 1. Open on the **statewide map**, slowly rotating.
- 2. Cursor rests on the **789 UNSOLVED CASES** counter.
- 3. At *"no offender ID"* – hold still and let it land.

0:20 The reveal

25 sec

SAY

"So we link them by **how the crime was committed** rather than by who was named. Out of seven hundred and eighty-nine unsolved cases across sixty-nine stations and nineteen districts, it finds **sixteen offender groups – and every single one crosses a station boundary**. Here is the strongest: five robberies, three different police stations, and the officer who handled the first would never have looked at the fifth."

68 words

DO

- 1. Sweep the KPI row: **16 LINKED GROUPS**, then **16 ACROSS STATIONS**.
- 2. Click lead **01 · Robberies · Chitradurga**.
- 3. Case file opens and the map lights that group's cases.

0:45 It shows its working

20 sec

SAY

"And it shows the reasoning rather than asking you to trust it. These are the signals that actually drove the link – the method, the crime type, the timing – and every case underneath carries a **real FIR number** an investigating officer can pull from the record today."

48 words

DO

1. Scroll to **WHY WE LINKED THESE** – the contribution bars.
2. Cursor down the bars as you name them.
3. Scroll to the case list, hover a real **1056600452025...** number.

1:05 Where it strikes next

27 sec

SAY

"Because we now know these five are one offender, they stop being history. Every group gets its own projection, and it is written out in plain words rather than coordinates. This one is due inside a window of about ten days, **within eight kilometres – covering two named police stations**. That is somewhere you can actually send a patrol."

59 words

DO

1. Click **FORECAST** in the rail – the teal-bordered tab.
2. Show the ranked list of all 16 projections.
3. Open **SER-001**, scroll to **IN PLAIN WORDS**, let it be readable.
4. Point at the **teal ring** on the map.

1:32 The link nobody could see

20 sec

SAY

"This is the thing the database simply cannot do. Twenty-five people who never appear together in any FIR, connected because they work the same method in the same patch. Click one and **their entire crime history drops onto the map**, in the order it happened."

45 words

DO

1. Click **NETWORK** → **People** – labelled graph, 21 inferred links.
2. Click someone with several links, e.g. **Girish Shetty**.
3. Map draws the **violet trail** in date order – pause on it.

1:52 Monday morning

20 sec

SAY

"That is all looking backwards. This is the Monday morning version – a new FIR comes in, you drop in the brief facts, and it is scored against **every group we already know about**, so it gets flagged before anyone works it as an isolated case and it goes cold."

50 words

DO

1. Click **NEW FIR**.
2. Click **Use an example** – the form fills itself.
3. Click **Check for matches** and let the verdict render.

2:12 We tried to break it

33 sec

SAY

"And this is what I would most want you to look at. Precision **ninety-three percent**, recall **ninety-seven**, every planted group recovered – computed live by the same engine running this screen. Then we tried to break it. We scrambled the data so no pattern could survive, and the engine returned **zero groups, every single time**. We also tested whether the accused name helps link cases: it made the engine **worse**, so identity now carries no weight at all. We published the experiment that proved us wrong."

86 words

DO

1. Click **MODEL**.
2. Cursor across the three metrics, then **13/13 recovered**.
3. Scroll to **DOES IT INVENT GROUPS?** – hold on **16 vs 0 • 0 • 0**.
4. Scroll to the **identity experiment** table.

2:45 Close

15 sec

SAY

"So it is not really a dashboard. **It reopens cold cases, and it points you at where the next one is likely to happen** – and it runs entirely on Zoho Catalyst."

32 words

DO

1. Back to the **statewide map**, slowly rotating.
2. Hold the wide shot. **Stop talking before you stop recording**.

RECORDING NOTES

Record picture and voice separately if you can. One clean click pass, then read over it. Doing both at once is where most takes die.

Never narrate the clicking. No "now I'll click on" – just click. The lines are written so the action and the sentence land together.

Slow down on the numbers and on "zero groups, every single time". That is the line the panel will remember.

If you overrun, cut beat 6 (Monday morning). It is the easiest to describe in the deck. Never cut beat 7 – the negative control and the identity experiment are the most distinctive things you have.

Give the map a beat to draw after each tab switch, or you will be talking over a blank stage.
