

Drishti in three minutes

Read the left column, do the right column. It's written to be **spoken, not read aloud** — contractions, connectives, sentences that run on the way people actually talk. Each beat's word count is sized to its seconds at a relaxed pace, so you can take your time and still land on three minutes. Numbers are spelled the way you'd say them.

BEFORE YOU HIT RECORD

1. **Warm the engine.** Open the app 2 minutes early and wait for the status bar to read **ENGINE LIVE** . A cold start shows zeros and will ruin the take.

2. **Open four tabs in this order** so you never navigate live: `/app/index.html` · `?group=SER-001` · `?tab=triage` · `?tab=model` · `?role=investigator&district=577`

3. **Browser at 1920×1080, full screen, no bookmarks bar.** Hide your cursor when not pointing at something.

4. **Do a silent dry run** of the clicks once. The only risky beat is the triage form.

0:00

The gap

20 sec

SAY

"Across Karnataka there are thousands of unsolved cases sitting in the system, and they stay isolated for one simple reason — the FIR database **has no offender ID**. An accused is only a name typed into one FIR, so if the same person is working across several stations, nobody ever connects them."

52 words

DO

1. Open on the **statewide map**, slowly rotating.

2. At "*thousands of undetected cases*" — cursor rests on the **789 UNSOLVED CASES** counter.

3. At "*no offender ID*" — hold still. Let the sentence land.

0:20

The reveal

27 sec

SAY

"So what we built links those cases by **how the crime was actually committed**, rather than who was named in it. Across seven hundred and eighty-nine unsolved cases and sixty-nine stations, it finds **sixteen offender groups, and every one crosses a station boundary**. Here's the strongest — five robberies across three different police stations, and the officer handling the first would never have looked at the fifth."

67 words

DO

1. Cursor sweeps the KPI row: **16 LINKED GROUPS**, then **16 ACROSS STATIONS**.
2. Click lead **01 • Robberies • Chitradurga** in the right panel (or switch to the `?group=SER-001` tab).
3. The case file opens and the map lights the group's cases. Pause on it.

0:47

It shows its working

28 sec

SAY

"And it doesn't just assert that link, it shows you the reasoning. This breaks it into the signals that actually drove it — the method, the crime type, the timing — and every case underneath carries a **real FIR number** you can pull from the record. A name does turn up in three of the five, but we mark it unconfirmed, and it played no part in the grouping."

69 words

DO

1. Scroll to **WHY WE LINKED THESE** — the contribution bars.
2. Cursor down the bars as you name them.
3. At "*real FIR number*" — scroll to the case list, hover a `1056600452025...` number.
4. At "*a name does appear*" — point at the amber **"Ravi Kumar" — unconfirmed lead** banner.

1:15**Where it strikes next**

29 sec

SAY

"And because we know these five are one offender, they stop being just history. The group has a rhythm, and a patch it tends to work, so we can project where the next one falls — **this window, within about eight kilometres**, drawn as the ring on the map. We tested that by hiding each group's last offence and predicting from the rest, and **the area is right about ninety-three percent of the time.**"

74 words

DO

1. Scroll to the amber **WHERE THIS GROUP MAY STRIKE NEXT** card.
2. Cursor on **EXPECTED WINDOW**, then **LIKELY AREA — within 8.3 km.**
3. Move to the map and circle the **amber forecast ring.**

1:44**Monday morning**

20 sec

SAY

"That's all looking backwards. This is the Monday morning version — a new FIR comes in, you drop in the brief facts, the crime type, where and when, and it scores that against **every group we already know about**, so it gets flagged **before** anyone works it as a one-off."

50 words

DO

1. Click **NEW FIR** in the left rail.
2. Click **Use an example** — the form fills itself.
3. Click **Check for matches.**
4. Let the verdict render, then cursor on the matched group and its **fit percentage.**

2:04

We measured it – and published what it cost us

31 sec

SAY

"And this is the part I'd most want you to look at. Precision is around ninety-three percent, recall ninety-seven, and **every planted group was recovered** – computed live by the same engine running this screen. We'd assumed the accused name would help link cases, so we tested it, and it **made things worse** – recall dropped from ninety-seven to eighty-five. So identity carries **no weight at all** now, and we published the experiment that proved us wrong."

77 words

DO

1. Click **MODEL** in the left rail.
2. Cursor across the three big metrics, then **13/13 groups recovered**.
3. Scroll to "**Should the accused name influence...**".
4. At "*made the engine worse*" – hold on the two-row table so the **0.854 → 0.965** jump is readable.

2:35

Who gets to see what

14 sec

SAY

"One last thing – three roles, enforced on the server. An **investigator only sees their own district**, and persons of interest is locked off, because that's a list of people who haven't been charged with anything."

36 words

DO

1. Switch to the **?** `role=investigator&district=577` tab.
2. Cursor on the KPI row – **43 cases, 3 groups**, down from 789.
3. Point at the **padlocks** on PEOPLE, INSIGHTS and MODEL.

2:49

Close

11 sec

SAY

"So it isn't really a dashboard. **It reopens cold cases, and points you at where the next one is likely to happen** – running entirely on Zoho Catalyst."

28 words

DO

1. Back to the **statewide map**, slowly rotating.
2. Hold the wide shot. **Stop talking before you stop recording** – leave a second of silence.

Record the screen and the voice separately if you can. Do a clean screen pass with the clicks at the right moments, then read the script over it. Trying to do both at once is where most takes die.

Don't narrate the clicking. Never say "now I'll click on" — just click. The script is written so the action and the sentence land together.

Slow down on the numbers. "Zero point nine three" needs more time than it looks like on the page. Everything else can move.

If you overrun, cut beat 7. Access control is the least surprising 15 seconds and the deck covers it. Never cut beat 6 — the identity experiment is the most distinctive thing you have.

The map takes a moment to draw after each tab switch. Give it a beat before you start the next line, or you'll be talking over a blank stage.
